

TITLE

Self Clearing Grilling Fork

ABSTRACT

5 A self-clearing grilling fork designed so that the user can effectively remove any
food on the tines using a built-in mechanism located in the handle. This built-in
mechanism connects to a food removal plate on the tines of the fork. As the food removal
plate slides down the tines it pushes off any food present on the tines. This design allows
the user to both pierce and remove food from the fork using just one hand, negating the
10 need for another cooking utensil or the user's finger to remove the food, and leaving the
user's other hand free. Furthermore, the users hand(s) are kept far from the heat of the
food and grill/cooking apparatus, minimizing the chance of acquiring burns during to the
cooking process.
